

THE QUANTUM KID

INITIAL APPOINTMENT
SUMMARY & TREATMENT PLAN

Vincent

INITIAL APPOINTMENT SUMMARY & TREATMENT PLAN

27 October 2025

Dear Joseph,

Thank you for visiting The Quantum Kid and entrusting us with an opinion on Vincent's health goals, namely;

1. Looking at jaw and bite alignment
2. Teeth overcrowding since Invisalign
3. Struggles with swallowing when having fluids

Vincent was a lovely young patient to have in the clinic and it was great to hear about your family's journey to date.

Key points outlined in Vincent's history:

- Had Invisalign - had some relapse
- Does Muay Thai
- Went really well with Brain Hub - was pretty good on the scan
- Forceps birth
- Prolonged pacifier use

Dental Findings:

- Mixed (adult and kids) teeth
- Retained upper right second primary molar which is ankylosed
- Retained upper left primary canine
- No cross bite, no open bite
- The shape of the palate is wide at the back but narrow towards the front
- Width between the upper first molar is: 34mm which is slightly narrow for his height.
- Mouth opening is 40mm which is slightly restricted
- Tongue has a mild tie but is functional and does not require tongue tie release
- Tonsils are not enlarged or inflamed

Osteopathic Findings:

- Primary issue is structural relating to birth strain
- Strain type is called a lateral strain
- There are a number of structural compensations based on the strain, which
- can be helped by the ALFappliance and cranial treatment with our osteopath

QUANTUM KID PROGRAM

What is a cranial strain?

This is a term used in cranial osteopathy. Imagining a child's skull as a finely balanced web of interrelated parts; bone, membranes, muscles, neural structures and fluid makes it easy to understand the complexity of the growing skull and face.

In assessing and treating these structures, cranial osteopaths believe they have a very subtle yet palpable motion – almost like a warping, to allow expansion and contraction of the brain in a rhythmical fashion and thus there are perceptible changes to motion and balance of these tissues.

When balance has been disrupted, often by birth trauma, falls, or stress the joints of the skull can compress to predictable patterns or "strains" that can be recognised by skilled clinicians.

While not visibly obvious by eye, these strains affect the body much like a warp in a guitar neck for example may keep making it go out of tune. When thinking about these strains remember they're not a hard, fast rule or even a major issue to be worried about, but they can drive some of those symptoms that until now seem to fly "under the radar".

In Vincent's case there is what's described as a "Lateral Strain" present. A good visualisation for this strain is to imagine the skull shifts sideways into a parallelogram shape, remember these movements are very subtle and not obvious to the eye. A Lateral Strain is considered "non-physiologic", meaning it's difficult for the body to work around the strain, as such they can subtly affect coordination, balance, vision and can disrupt overall wellbeing.

Treatment plan:

Vincent's treatment will be best divided into two phases:

1. Orthopaedic phase

extract upper left primary canine tooth

Dental Health Screen

ALF appliance on the Align program

We feel that Vincent would strongly benefit from wearing an ALF Appliance whilst sleeping and for some time ideally in the afternoon. Potential benefits of the ALF Appliance can include:

A shift to nose breathing

A physiological effect for the jaws and teeth which helps to optimise the shape and symmetry of the facial structures

Better, more restful quality of sleep

Improved outcomes from manual therapy treatments (osteo/chiro)

Better behaviour/concentration/focus as a result of a more balanced nervous system and reduction in cranial strain

An improvement in overall health

Vincent may push back against wearing the ALF Appliance, it's not uncommon but we've found consistent, firm yet caring persistence pays off, the kids who get the best results wear the ALF Appliance each and every night.

In concert with the ALF, Vincent is suited to The Quantum Kid Align Program which has been outlined for you in the documents you received during our consult and includes 12 months of appliance adjustments and cranial osteopathy plus our flagship breathing and Face Gym programs.

2. Orthodontic phase

This phase may not be necessary. It will depend on how Vincent's teeth respond to ALF treatment during the orthopaedic phase. If there is still some residual realignment that needs to be done, we feel that another short course of clear aligners will be great to finalise the dental alignment of his teeth.

Thank you again for attending The Quantum Kid. We're confident in our system and we look forward to helping Vincent.
